INTRODUCTION

Pioglitazone HCl (PLZ) Fig.1, [(±) 5 {p [2 (5 ethyl 2 pyridyl)ethoxy] benzyl} 2, 4 thiazolidinedione hydrochloride] is an oral antidiabetic agent used in the treatment of type 2 diabetes mellitus also known as non insulin dependent diabetes mellitus (NIDDM) or adult onset diabetes. Pioglitazone decrease insulin resistance in the periphery and liver, resulting in increased insulin dependent glucose disposal and decreased hepatic glucose output. Currently, it is marketed under the trade name Actos®. It is a white or almost white crystalline, odourless powder, practically tasteless, insoluble in water and alcohols, but soluble in 0.1 N NaOH; it is freely soluble in dimethylformamide. It exhibits slow gastrointestinal absorption rate and inter individual variation of its bioavailability. A survey of literature reveals that metal complexes of many drugs have been found to be more effective than the drug alone therefore, much attention is given to the use of thiazolidinedione hydrochloride due to their high complexing nature with essential metals. Fig.2 shows the enolization nature of complex formation. Zinc is an essential trace metal, so we get it through the food we eat. Next to iron, zinc is most common mineral in the body and is found in every plant and animal cell. It has been used since ancient times to heal wounds.

SYNTHESIS, PHYSICO-CHEMICAL, SPECTRAL AND X-RAY DIFFRACTION STUDIES OF ZN(II) COMPLEX OF PIOGLITAZONE - A NEW ORAL ANTIDIABETIC DRUG

ABSTRACT

Present paper deals with the synthesis, spectral characterization and X-ray diffraction study of Zn(II) complex with Pioglitazone a new oral antidiabetic drug. The conductometric titration using monovariation method indicate that complex is ionic and L\textsubscript{2}M type which was further confirmed by Job's method of continuous variation as modified by Turner and Anderson. Analytical data agree with the molecular formula of complex viz. \[\text{[C}_{19}\text{H}_{19}\text{N}_{2}\text{O}_{3}\text{S}]^2\text{Zn}]^2\text{Cl}^-\]. Structure of complex was assigned as tetrahedral, in which ligand molecules lies horizontally joining the central Zn(II) atom, supported by IR, \(^1\text{H} NMR\) and Mass studies. X-ray diffraction data also supports the complex formation and symmetry of complex.

Key words: Pioglitazone, antidiabetic drug, complex, IR, \(^1\text{H} NMR\), Mass and X-ray diffraction.
and plays an important role in the immune system, reproduction, growth, vision, blood clotting, proper insulin and thyroid function.\textsuperscript{6-7}

Chelates of streptomycin are obtained by adding aqueous solutions of zinc salts to the solution of streptomycin at pH 9.0 (loc. cit). Zinc complex of sulpha drugs have been prepared and studied by Salil \textit{et al.},\textsuperscript{8} Bipin \textit{et al.},\textsuperscript{9} Sharma \textit{et al.},\textsuperscript{10} Iqbal and co-workers \textsuperscript{11-13} and compare the antidiabetic properties of zinc complex with the parent drugs.

**EXPERIMENTAL**

**Ligand- Metal ratio**

To confirm the ligand metal ratio, conductometric titration using monovariation method were carried out at 27 ± 1 °C, 0.005M solution of pioglitazone HCl drug was prepared in DMF. Similarly, solution of metal salt ZnCl\textsubscript{2} was prepared in the ethanol of 0.01M concentration. 20ml of ligand was diluted to 200ml with the same solvent. The ligand was titrated against metal salt solution using monovariation method. Conductance was recorded after each addition, graph is plotted between corrected conductance and volume of metal salt added. From the equivalence point in the graph it has been concluded that the complex formation has taken place in the ratio of 2:1 (L\textsubscript{2}M). Stability constant and free energy change were also calculated using Job’s method\textsuperscript{14} of continuous variation modified by Turner and Anderson \textsuperscript{15} Fig. 3 (a, b).

![Fig. 3: (a) Job’s curve (b) Modified Job’s curve](image3)
Material and Reagents

All chemicals used were of analytical grade and of highest purity. They include pure sample of pioglitazone HCl with molecular formula \((C_{19}H_{20}N_{2}O_{3}S\cdot HCl)\), received from Morepen Laboratories Limited Panwanoo, Distt. Solan (H. P.) India. The metal salt of ZnCl\(_2\) obtained from Hi media Laboratory, Mumbai, India. Ethanol and DMF were used as a solvent.

Synthesis of Complex

A weighed quantity of “Pioglitazone” (2 mol) was dissolved separately in minimum quantity of DMF. Zinc solution was prepared by dissolving separately in the ethanol. Ligand solution was added slowly with stirring into the solution of metallic salt at room temperature; maintain the pH between 6.0 to 6.5 by adding dilute NaOH solution. On refluxing the mixture for 3-4 h at 70°C and on cooling, white colored crystals were obtained which were filtered off, washed well with DMF and finally dried in vacuum and weighed (yield 51.08%).

Instrumentation

Molar conductance of solid complex in DMF was measured by using Systronics Digital Conductivity meter. Melting point was determined by Perkin Elmer model melting point apparatus and is uncorrected. The elemental analysis of the isolated complex was carried out by using Coleman analyzer model at the Departmental Micro Analytical Laboratory, CDRI, Lucknow, India. IR spectra of ligand and complex were recorded with Perkin Elmer Model 577 Spectrophotometer in the range of 4000-450 cm\(^{-1}\) as KBr pellets CDRI, Lucknow, India. \(^1\)H NMR spectra of the ligand and isolated complex were recorded on a Bruker DRX-300 Spectrophotometer and d\(_{6}\)-DMSO was used as solvent CDRI, Lucknow, India. X-ray diffraction studies were carried out by X-ray diffractometer model with 45kV rotating anode and Cuk\(_\alpha\) (1W=1.54060A\(^{-}\)) radiation at Punjab University, Chandigarh, India.

Mass spectra of zinc complex was recorded at CDRI, Lucknow, India which provides information about the complex by examining the fragmentation pattern and total mass of the complex. Proposed structure for the isolated complex (Fig.-4) are also supported by mass spectral studies of Mc Cullagh \textit{et al.}, \(^{16}\) Bayliss and Lashin., \(^{17}\) Windig \textit{et al.}, \(^{18}\) Andrew., \(^{19}\) Mc Lafferty, \(^{20}\) Iqbal \textit{et al.}, \(^{21}\).

RESULTS AND DISCUSSION

Physico-chemical Characteristics of “Pioglitazone”- Zinc complex

Molecular formula [(C\(_{19}\)H\(_{19}\)N\(_{2}\)O\(_{3}\)S\cdot Zn)2HCl]

Mol.wt: 851.17; Colour:White; Yield:51.08%; m.p:197°C; C, 53.61 (53.50), H, 4.69 (4.48), N, 6.57 (6.52), S,7.53 (7.36), Metal,7.68 (7.63), Cl, 4.18 (3.94), Log K= 11.76 (L/mole), \(\Delta F\)=-16.19 (K cal/mole).

Infra-red Spectral Studies

The IR spectrum\(^{22-24}\) of isolated complex were recorded within the range 4000-400 cm\(^{-1}\). Assignments of the infrared spectral bands are based on literature. IR spectrum of PLZ-Zn complex (Fig. 4) shows important bands due to \(\nu(M-O)\) 509±10 cm\(^{-1}\), \(\nu(Aromatic \ C-H \ streatching)\) 771 cm\(^{-1}\),

![Fig. 4: IR spectra of PLZ and its Zn Complex](image-url)
ν(C=O) 1623 cm⁻¹, ν(C-H stretching) 2736±20 cm⁻¹, (C-H stretching) 2850±20 cm⁻¹, ν(Ar-H stretching) 3095 cm⁻¹, ν(N-H) 3476 cm⁻¹. The proposed structure for the isolated complexes is also supported by IR absorptions. ζ. The proposed structure for the isolated complexes (Fig-5) is also supported by Slichter (1963), Akit (1973), Siewers (1973), Dury et al., (2012) Rathod et al., (2012), Jacob and Iqbal et al., Budhani et al.

**1H NMR Studies**

Assignment of “Pioglitazone”- zinc complex, molecular formula [(C₁₉H₁₉N₂O₃S⁺)₂Zn(2Cl⁻), (M.W.=851.17), δ8.72 (s,1H,2-pyridine), δ8.39-8.42 (d,1H, 2-pyridine), δ7.95-7.98(d,1H, 2-pyridine), δ7.12-7.15(d,2H, 2-CH₂-Benzene), δ6.85-6.88(d,2H,2-CH₂-Benzene), δ4.84-4.88(m,1H methine-CH), δ4.36-4.41(t, 2H methylene-CH₂), δ3.46-3.93(t, 2H methylene-CH₂), '3.01-3.39(d, 2H methylene-CH₂), δ2.50-2.80(s, Residual solvent DMSO-d₆), '1.25(t,3H methyl-CH₃) respectively. The proposed structure for the isolated complex (Fig-5) is also supported by Slichter (1963), Akit (1973), Siewers (1973), Dury et al., (2012) Rathod et al., Jacob and Iqbal et al., Budhani et al.

**Mass Spectral studies**

Mass spectra represents the intensities of signals at various m/z values. It is highly characteristic of the compound that no two compounds can have similar mass spectra. It provides information regarding the molecular structure of organic and inorganic compounds. In present paper we studied the “Pioglitazone”- zinc complex and assignments are:- Molecular formula of complex [(C₁₉H₁₉N₂O₃S⁺)₂Zn(2Cl⁻), (M.W.=851.17), m/z 850 due to [(C₁₉H₁₉N₂O₃S⁺)₂Zn(2Cl⁻) or (ML₂⁺) Molecular ion peak (m⁺); m/z 357 due to [C₁₉H₁₉N₂O₃S⁺]⁺ base peak ion 100% relative abundance, m/z 223 due to [C₁₀H₇NO₃S⁺]⁻, m/z 134 due to [C₈H₁₈N⁺]⁺. Mass spectra represents the intensities of signals at various m/z values.

**X-Ray Diffraction Studies**

X-ray diffraction studies also confirm the complex formation due to new bonds. The number of peaks in Pioglitazone are more as compared to their zinc complex Fig.6 (a, b) which shows the formation of complex. Moreover, all the reflections are new ones and the patterns are fairly strong. On comparing the pattern obtained with available literature, it is evident that its pattern is not in good agreement with available information and thus confirms the formation of totally new complex . The X-ray pattern have been indexed by using computer software (FPSUIT 2.0V) and applying interactive trial and error method keeping in mind the characteristics of the various symmetry system, till a good fit was obtained between the observed and the calculated Sin² value. The unit cell parameters were calculated from the indexed data, cell data and crystal lattice parameters, Zn(II) indicates complex attributed to orthorhombic crystal system. The particle size is 19.16 microns of “Pioglitazone”-zinc complex respectively, which is calculated from x-ray line broadening using the Scherrer formula $D_{hkl} = \frac{\gamma}{\beta} \cos \theta$, where $D$ is the particle diameter in Å, $\gamma$ is a coefficient and is equal to 0.89 here, $\beta$ is the half-maximum line width, and $\theta$ is the wavelength, $\frac{d_{true} - d_{obs} \times 10^6}{d_{true}}$ calculated by formula $\gamma$ is found 0.0607 gcm⁻³ for “Pioglitazone”-zinc complex respectively. Space group is Pmmn and $\alpha=90°$, $\beta=90°$, $\gamma=90°$.

![Fig. 5: Structure of Pioglitazone –Zinc Complex](image-url)
CONCLUSION

For supporting the proposed structure of zinc complex with “Pioglitazone” initially Job’s method of continuous variation as modified by Turner and Anderson was conducted which indicate 2:1 ligand:metal ratio, moreover stability constant and free energy change was also calculated. Analytical data agree to the molecular formula viz. \([\text{C}_{19}\text{H}_{19}\text{N}_{2}\text{O}_{3}\text{S}]^{2+}\text{Zn}]^{2}\text{Cl}^{-}\). For the complexation of “Pioglitazone” with zinc, it was concluded that the “Pioglitazone” undergoes enolization before complexation so as to form a hexacyclic heterocyclic chelate ring. The formation of complex through enolization is also supported from the frequency of IR, \(^1\text{H} \text{NMR}\) and Mass spectral studies. Molar Conductance values of complex support the ionic structure of the complex. The thiazolidinedione unit inside the coordination sphere has a positive charge while \(\text{Cl}^{-}\) occupies the outer place of the coordination sphere. A detailed study of X-Ray also supports the complex formation and the various values like particle size, porosity, volume of unit cell, density as well as crystal system was evaluated and discussed.

ACKNOWLEDGEMENTS

The authors are thankful to UGC (New Delhi) for the financial support and CDRI Lucknow, P.U. Chandigarh for providing IR, NMR, Mass and X-Ray data.
