ABSTRACT

Cyclic ketoximes having a \( \alpha \)-methylene group on reaction with chloramine-T followed by treatment with triethylamine generate \( \alpha \)-nitrosoalkenes via \( \alpha \)-chloronitroso intermediates, which are further treated with alkenes to give fused-oxazines.

Keywords: Fused-oxazines, \( \alpha \)-nitrosoalkenes, Chloramine-T.

INTRODUCTION

1,2-Oxazine and their fused counterparts received interest in these years due to their diverse synthetic and pharmacological importance. 1,2-Oxazine derivatives are useful synthetic building blocks in heterocyclic chemistry. In our preceding report\(^1\), we have disclosed the method to obtain \( \alpha \)-nitrosoalkenes from ketoximes having \( \alpha \)-methylene group and their cycloaddition with olefinic compounds to 1,2-oxazines. \( \alpha \)-Nitrosoalkenes behave like dienes (4π-electron component) in Hetero-Diels-Alder reaction. Further to our research on oxazines and their counterparts, we are reporting the synthesis of \( \alpha \)-nitrosoalkenes from cyclic ketoximes bearing a \( \alpha \)-methylene group and their cycloaddition with dienophiles to yield fused-oxazines, which are having huge synthetic applications\(^2,3\) and biological use as therapeutic agents\(^4,7\). Generation of \( \alpha \)-nitrosoalkenes is quite difficult. Usually they are reactive intermediates and unstable, hence they are only generated \textit{in situ}\(^2\).

In our prior work chloramine-T was used extensively for the synthesis of \( \alpha \)-nitrosoolefins\(^1\), azoalkenes\(^8,9\), nitrile oxides\(^10\), nitrile imines\(^11\) etc., which undergo cycloaddition with active dienes yield bioactive heterocycles. During the studies, cyclohexanone oxime was reacted with chloramine-T formed a blue colour indicates the
formation of chloro-nitroso intermediate, which produces 1-nitroso-cyclohexene on treatment with a base. With this achievement, we are now reporting a new method for the conversion of cyclic ketoximes having an active methylene group into α-chloronitroso intermediates, which are appropriate for in situ formation of α-nitrosoalkenes which acts as dienes and undergo [4+2] cycloaddition with dienophiles.

**RESULTS AND DISCUSSIONS**

Cyclic ketoximes having a α-hydrogen atom on treatment with chloramine-T followed by treatment with a base are oxidized to α-nitroso alkenes which undergo Hetero-Diels-Alder reaction with olefinic compounds to produce fused-oxazines in good yield. Typically, the reaction was performed by boiling an equimolar mixture of cyclic ketoxime and chloramine-T in ethyl alcohol followed by addition of a base and an alkene. Overall fused-1,2-oxazines are synthesized in good yield as indicated in the scheme 1.

$^{13}$C NMR spectrum of all fused-oxazines gave expected signals for the newly formed ring carbons. For instance, in fused-oxazine 4 (when X=H) the peak due to $\text{C}_3$ observed around $\delta$ 54-67 ppm while 4 (when X=CH$_3$) seen around $\delta$ 62-69 ppm and a new signal was observed around $\delta$ 23-26 ppm indicative of the methyl group. The signal in oxazine 4c at $\delta$ 119 ppm is indicative of the CN group. The stable molecular ion peaks were seen in the Mass spectrum which supports the structure of the newly formed oxazines. The product formation further confirmed by elemental analyses. 1,2-Oxazines and their fused counterparts are potentially very useful heterocycles in synthetic chemistry, and act as useful building blocks for the construction of complex and new heterocyclic compounds.

In summary we have established that fused-oxazines can be produced by the reaction of cyclic ketoximes having a α-methylene group with olefinic compounds in the presence of chloramines-T and a base in good yield.

**EXPERIMENTAL**

$^1$H NMR and $^{13}$C NMR spectra were taken at 400 MHz and 100 MHz respectively on Bruker Avance 400 spectrometer using DMSO-d$_6$ or CDCl$_3$ as solvents and TMS as internal standard. The chemical shifts are stated in $\delta$ ppm downfield shift from TMS. Mass spectrum was recorded on a Finnigan 4021 mass spectrometer using ionizing energy of 35 ev. Elemental analyses were performed using Vario-EL elemental analyzer. Reactions were checked for the completion by thin layer chromatography (TLC) on precoated silica gel plates using chloroform-ethyl acetate (7:3) as eluent.

**Representative process for the preparation of 3-Phenyl-4,4a,5,6,7,8-hexahydro-3H-benzo[c][1,2]oxazine 4a**

A mixture of cyclohexanone oxime 1 (1.0 g, 8.85 mmol) and chloramine-T. 3H$_2$O (2.51 g, 8.93 mmol) in ethyl alcohol (6 ml) were boiled for 1 hour. The reaction mass was cooled to rt. and triethylamine (1 ml) was added. The reaction mixture was further stirred for 30 minutes at rt. 3a (0.94 g, 9.03 mmol) dissolved in ethyl alcohol (3 ml) was then added to the above reaction mass and was further boiled 2 hr. After the completion of the reaction, ethyl alcohol
was removed under vacuum and the residue left behind was extracted with chloroform (2×20 ml). The combined chloroform extract was washed with H\textsubscript{2}O (15 ml), with dilute NaOH solution (210 ml) and dried over anhydrous magnesium sulfate. Chloroform was removed under vacuum and the oily mass left behind was purified by column chromatography (CHCl\textsubscript{3}:EtOAc, 8:2) to give 4a as a pale yellow oily product to yield 1.25 g (66%); 1\textsuperscript{H} NMR (CDCl\textsubscript{3}, 400 MHz): \(\delta\) 1.24-1.31 (m, 4H, 2X-CH\textsubscript{3}), 1.45-1.55 (m, 5H, 2X-CH\textsubscript{3} and -CH), 1.89 (t, 2H, -CH\textsubscript{2}), 4.61 (dd, 1H, J= 9.7 Hz & 2.5 Hz, -CH), 7.31 (s, 5H, ArH); 13\textsuperscript{C} NMR (CDCl\textsubscript{3}): \(\delta\) 24.4, 26.8, 29.5, 30.9, 32.6, 35.4, 81.2, 125.1, 128.4, 141.9, 162.5; MS (relative abundance) m/z: 215 (M\textsuperscript{+}, 8%), 138, 120, 95 (100%), 77, C, H and N. Calcd. for C\textsubscript{13}H\textsubscript{17}NO: C, 78.10; H, 7.96; N, 6.51 %. Found: C, 78.19; H, 8.04; N, 6.43 %.

3-Methyl-3-phenyl-4,4a,5,6,7,8-hexahydro-3H-benzo[c][1,2]oxazine-4b

The product was synthesized from 1 (1.0 g, 8.85 mmol), 3b (0.48 g, 9.05 mmol), chloramine-T, 3H\textsubscript{2}O (2.51 g, 8.93 mmol) and TEA to give yellow oily product to yield 1.31 g (65%); 1\textsuperscript{H} NMR (CDCl\textsubscript{3}): \(\delta\) 1.26-1.35 (m, 4H, 2X-CH\textsubscript{3}), 1.45-1.55 (m, 5H, 2XCH\textsubscript{2} and CH), 1.71 (s, 3H, CH\textsubscript{3}), 1.93 (d, 2H, CH\textsubscript{2}), 7.41 (s, 5H, ArH); 13\textsuperscript{C} NMR (CDCl\textsubscript{3}): \(\delta\) 23.6, 26.1, 29.2, 30.7, 31.5, 32.9, 34.2, 74.6, 125.9, 128.5, 129.0, 139.1, 162.2; MS (relative abundance) m/z: 229 (M\textsuperscript{+}, 12%), 152, 134, 95 (100%), 77, C, H and N. Calcd. for C\textsubscript{15}H\textsubscript{19}NO: C, 78.56; H, 8.35; N, 6.11 %. Found: C, 78.50; H, 8.41; N, 6.03 %.

4,4a,5,6,7,8-Hexahydro-3H-benzo[c][1,2]oxazine-3-carbonitriile 4c

The product was synthesized from 1 (1.0 g, 8.85 mmol), 3c (0.48 g, 9.05 mmol), chloramine-T, 3H\textsubscript{2}O (2.51 g, 8.93 mmol) and TEA to give a yellow oily product to yield 1.03 g (71%); 1\textsuperscript{H} NMR (CDCl\textsubscript{3}): \(\delta\) 1.28-1.34 (m, 4H, 2XCH\textsubscript{2}), 1.42-1.51 (m, 5H, 2XCH\textsubscript{2}
and CH), 2.12-2.17 (m, 2H, CH\textsubscript{2}), 4.69 (dd, 1H, CH); 13\textsuperscript{C} NMR (CDCl\textsubscript{3}): \(\delta\) d 23.2, 26.1, 30.9, 31.3, 34.3, 35.5, 70.3, 118.2, 162.2; MS (relative abundance) m/z: 164 (M\textsuperscript{+}, 13%), 163, 136, 95 (100%), 69, C, H and N. Calcd. for C\textsubscript{14}H\textsubscript{19}NO: C, 65.83; H, 7.37; N, 17.06 %. Found: C, 65.89; H, 7.30; N, 17.11 %.

4,4a,5,6,7,8-Hexahydro-3H-benzo[c][1,2]oxazine-3-carboxylic acid ethyl ester 4d

The product was synthesized from 1 (1.0 g, 8.85 mmol), 3d (0.90 g, 9.0 mmol), chloramine-T, 3H\textsubscript{2}O (2.51 g, 8.93 mmol) and TEA to give a yellow oily product to yield 0.48 g (72%); 1\textsuperscript{H} NMR (CDCl\textsubscript{3}): \(\delta\) 1.29 (t, 3H, CH\textsubscript{3}), 1.35-1.44 (m, 8H, CH\textsubscript{2}), 1.55-161 (m, 1H, CH), 2.22 (t, 2H, CH\textsubscript{2}), 4.28 (dd, 1H, CH), 4.69 (q, 2H, CH\textsubscript{2}); 13\textsuperscript{C} NMR (CDCl\textsubscript{3}): \(\delta\) 12.6, 27.3, 29.4, 30.8, 33.0, 35.3, 61.1, 83.2, 163.2, 174.3; MS (relative abundance) m/z: 211 (M\textsuperscript{+}, 22%), 166 (100%), 138, 95, 71, C, H and N. Calcd. for C\textsubscript{15}H\textsubscript{19}NO\textsubscript{2}: C, 62.54; H, 8.11; N, 6.63 %. Found: C, 62.48; H, 8.19; N, 6.56 %.

3-Phenyl-3,4,4a,5,6,7-hexahydro-cyclopenta[c][1,2]oxazine 7a

The product was synthesized from 5 (1.0 g, 10.10 mmol), 3a (1.07 g, 10.28 mmol), chloramine-T, 3H\textsubscript{2}O (2.85 g, 10.15 mmol) and TEA to give a pale yellow oily product to yield 0.48 g (64%); 1\textsuperscript{H} NMR (CDCl\textsubscript{3}): \(\delta\) 1.33 (t, 2H, CH\textsubscript{3}), 1.46-1.55 (m, 5H, 2XCH\textsubscript{2} and CH\textsubscript{2}), 2.01 (t, 2H, CH\textsubscript{2}), 4.42 (dd, 1H, CH), 7.39 (s, 5H, ArH); 13\textsuperscript{C} NMR (CDCl\textsubscript{3}): \(\delta\) 26.2, 27.9, 32.6, 36.5, 41.2, 78.4, 125.8, 128.9, 129.2, 140.1, 161.0; MS (relative abundance) m/z: 201 (M\textsuperscript{+}, 11%), 124, 120, 81 (100%), 77, C, H and N. Calcd. for C\textsubscript{19}H\textsubscript{22}NO: C, 77.58; H, 7.51; N, 6.96 %. Found: C 77.48; H, 7.59; N, 6.91 %.
3-Methyl-3-phenyl-3,4a,5,6,7-hexahydro-cyclopenta[c][1,2]oxazine 7b

The product was synthesized from 5 (1.0 g, 10.1 mmol), 3b (1.20 g, 10.16 mmol), chloramine-T.3H₂O (2.85 g, 10.15 mmol) and TEA to give yellow oily product to yield 0.48 g (67%); ¹H NMR CDCl₃: δ 1.34 (t, 2H, CH₂), 1.48-1.55 (m, 4H, 2XCH₂), 1.64 (s, 3H, CH₃), 1.64-1.68 (m, 1H, CH), 1.98 (d, 2H, CH₂), 7.35 (s, 5H, ArH); ¹³C NMR CDCl₃: δ 24.2, 26.4, 33.3, 36.3, 38.9, 79.2, 125.3, 128.4, 128.8, 140.7, 162.3; MS (relative abundance) m/z: 215 (M⁺, 9%), 138, 134, 81 (100%), 77. C, H and N. Calcd. for C₁₄H₁₇NO: C, 78.10; H, 7.96; N, 6.51 %. Found: C, 78.19; H, 7.90; N, 6.58%.

3,4,4a,5,6,7-hexahydro-cyclopenta[c]pyridazine-3-carbonitrile 7c

The product was synthesized from 5 (1.0 g, 10.1 mmol), 3c (0.55 g, 10.37 mmol), chloramine-T.3H₂O (2.85 g, 10.15 mmol) and TEA as pale brown oily product to yield 0.48 g (69%); ¹H NMR CDCl₃: δ 1.39 (t, 3H, CH₂), 1.51-1.60 (m, 5H, 2XCH₂ and CH), 1.99 (t, 2H, CH₂), 4.79 (dd, 1H, CH), 4.79 (dd, 1H, CH), 4.79 (dd, 1H, CH), 4.79 (dd, 1H, CH), 4.79 (dd, 1H, CH), 4.79 (dd, 1H, CH), 4.79 (dd, 1H, CH); ¹³C NMR CDCl₃: δ 22.2, 27.8, 32.9, 37.6, 41.1, 71.2, 118.3, 161.5; MS (relative abundance) m/z: 150 (M⁺, 10%), 149, 122, 81 (100%), 69. C, H and N. Calcd. for C₈H₁₀N₂O: C, 63.98; H, 6.71; N, 18.65 %. Found: C, 63.90; H, 6.77; N, 18.69 %.

2-Phenyl-3,4,4a,5,6,7-hexahydro-2H-cyclopenta[c]pyridazine-3-carboxylic acid ethyl ester 7d

The product was synthesized from 5 (1.0 g, 10.1 mmol), 3d (1.03 g, 10.30 mmol), chloramine-T.3H₂O (2.85 g, 10.15 mmol) and TEA as a yellow oily mass to yield 0.48 g (68%); ¹H NMR CDCl₃: δ 1.29 (t, 3H, CH₃), 1.39-1.52 (m, 6H, 3XCH₂), 1.55-1.63 (m, 1H, CH), 1.954-2.01 (m, 2H, CH₂), 4.29 (dd, 1H, CH), 4.73 (q, 2H, CH₂); ¹³C NMR CDCl₃: δ 14.3, 21.3, 26.2, 30.8, 31.2, 33.9, 35.6, 61.2, 84.2, 161.2, 173.6; MS (relative abundance) m/z: 197 (M⁺, 11%), 152 (100%), 124, 116, 81, 71. C, H and N Calcd. for C₁₀H₁₅NO₃: C, 60.90; H, 7.67; N, 7.10 %. Found: C, 60.99; H, 7.60; N, 7.06 %.

CONCLUSION

We have established a simple and effective method for the synthesis of fused-oxazines from cyclic ketoximes by Hetero-Diels-Alder cycloaddition of in situ generated α-nitroso olefins with various alkenes.
