### ABSTRACT

The complex of Mn (II) compound with  $\text{Se}_4\text{N}_3\text{Br}$  synthesized, was analyzed by U.V., E.P.R. and X.R.D. spectra. From the results, it is evident that the complex is good conductor, having paramagnetic character and orthorhombic geometry.

**Key word:**  $\text{Se}_4\text{N}_3\text{Br}$ , Orthorhombic, Geometry, Magnetic susceptibility.

### INTRODUCTION

The complexes of halogenated derivative of  $\text{Se}_4\text{N}_4$  have been reported<sup>1,2</sup>. The adducts of  $\text{Se}_4\text{N}_3\text{Cl}$  with urea, thiourea, hydrazine and phenyl hydrazine have also been synthesized and reported<sup>3,4</sup>. The Mass and I.R. spectral studies Mn (II), Fe(III), Co (II) complex with  $\text{Se}_4\text{N}_3\text{Br}$  have been reported by us<sup>5-7</sup>. The present investigations are in continuation of previous work.

### EXPERIMENTAL

To synthesis the complex, first of all  $\text{Se}_4\text{N}_3\text{Br}$  was prepared by the reaction of dry HBr on  $\text{Se}_4\text{N}_4$ <sup>8,9</sup> which was prepared by the ammoniation of  $\text{SeBr}_4$  in benzene. Equimolar ratio of  $\text{MnCl}_2$  and  $\text{Se}_4\text{N}_3\text{Br}$  (1:1) was mixed and refluxed for 6 hrs. in DMF. The grayish product formed, was separated,

washed with D.M.F. and alcohol, dried and stored in vacuum desiccators over fused  $\text{CaCl}_2$ .

U.V.,E.P.R, and X.R.D. spectra of complex, were recorded subsequently on Perkin-Elmer-Lambda-15 spectrophotometer (200-800nm) Varian's X-E-4 band spectrometer at room temperature and PW-1710 X-ray power diffractometer using  $\lambda = 1.5418 \text{ \AA}$ ,  $\text{CuK}_\alpha$ , as source of radiation in the  $2\theta$  range  $0^\circ$ - $80^\circ$ .

### RESULTS AND DISCUSSION

On the basis of the quantitative ,Mass & I.R. spectral analysis the complex bromo Mn(II) tetra seleniazide has been assigned as  $(\text{Se}_4\text{N}_3\text{Br})_2 \text{MnCl}_2 \cdot 4\text{H}_2\text{O}$  (loc. cit). The U.V. spectrum (fig-1) consist three prominent peaks at 200, 222.5, 282.5 nm. Former two bands 200, 222.5, corresponding

6.2, and 5.57eV energy, showing the ionic environment are due to the charge transfer transition in the complex. The last band, 282.5nm is on account of  $p_{\pi}-d_{\pi}$  transition for  $Se_4N_3$  ring present in the complex. This is also confirmed from the frequencies ratios  $\nu_1/\nu_2=1.27$  less than 2. The oscillator strength 'f' of the order  $10^{-5}$  (Table-1, Column-3) suggest the low spin Laporte forbidden transition in the complexes which is due to the sharing of electrons in  $Se_4N_3$  ring. The low value of band gap energy,

$\Delta E_g$  (Table-1, Column-4) and high value of number of conducting electrons,  $N_c$  of the order of  $10^5$  expounds the good conductive nature of complex.

A single broad peak of high intensity has occurred in E.P.R. spectrum (fig-2) suggesting the paramagnetic character of complexes which is supported by the low value of magnetic susceptibility,  $\chi_A = 1.2352 \times 10^{-3}$  e.s.u. (Table-1, Column-10). The value of  $g_x = g_y = 1.9407$  (Table-

$$Q_{av} = 0.008343$$

$$a_0 = 8.4399 \text{ \AA}, b_0 = 18.8723 \text{ \AA}, c_0 = 9.2454 \text{ \AA} \text{ and } \alpha = \beta = \gamma = 90$$

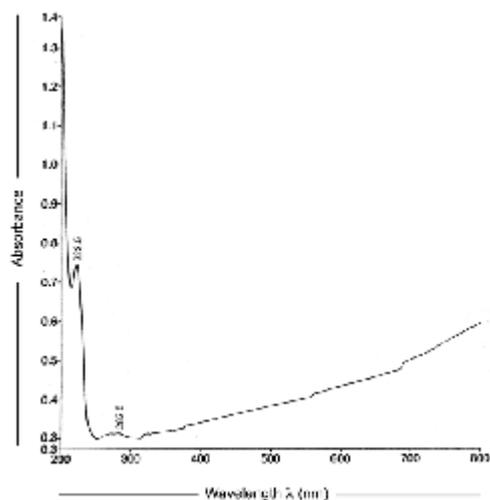

Fig. 1: U.V. spectrum of the Complex

1,Column-7) less than two explore the presence of vacant 3d energy shells in Mn atom to accept the electron pairs from N atom of  $\text{Se}_4\text{N}_3$  ring, forming coordinate bond. The value of  $g_z = 2.0790$  (Table-1,Column-8) greater than two indicate the sharing of electrons i.e. covalent bonding in  $\text{Se}_4\text{N}_3$  ring of the complex.

Thus bromo Mn(II) tetra seleniazide,  $(\text{Se}_4\text{N}_3\text{Br})_2\text{MnCl}_2 \cdot 4\text{H}_2\text{O}$  possess ionic bond due to  $\text{Mn}^{2+}$  and  $2\text{Cl}^-$ , coordinate bond,  $\text{Se-N} \rightarrow \text{Mn}$  and  $\text{Se-N}$ ,  $\text{Se-Br}$  covalent linkage with the  $3d^5$  configuration of  $\text{Mn}^{2+}$  because the value of  $\mu_{\text{eff}} = 1.7215$  is according to the presence of one unpaired electron. Thus the complex formed having quadridentated, coordinated linkage with square planar structure as reported (loc. cit) fig. 4.

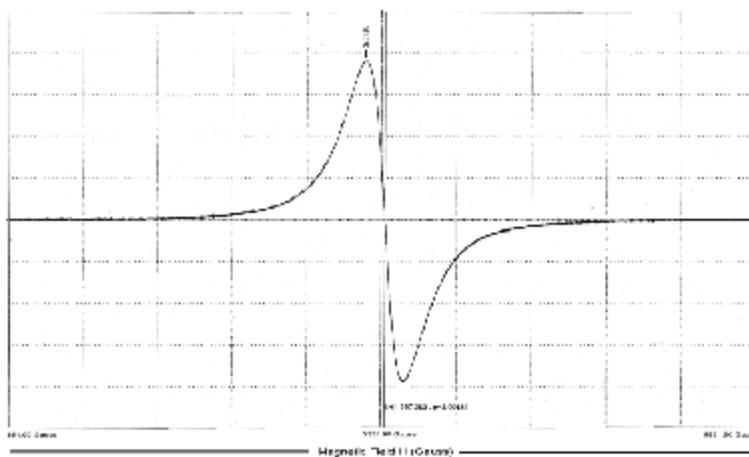

Fig. 2: E.P.R. spectrum of the Complex

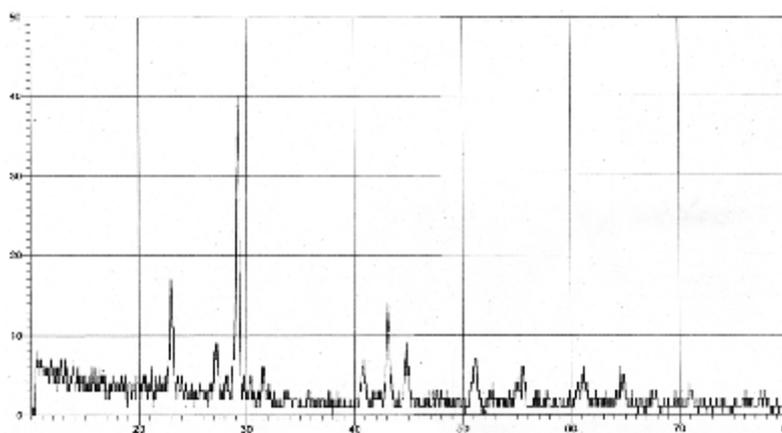

Fig. 3: X.R.D. Pattern of the Complex

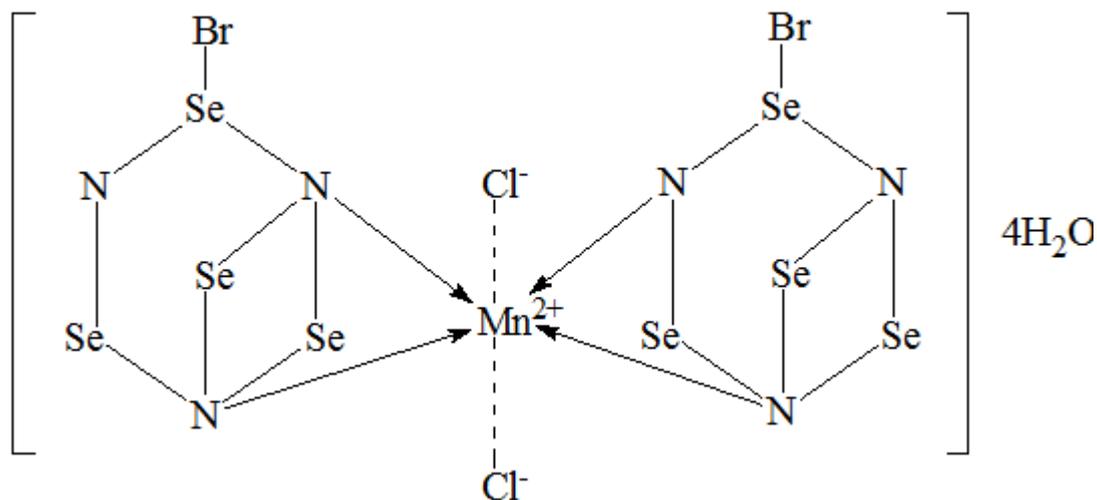

Fig. 4: Proposed Geometrical Structure of Complex,  $(\text{Se}_4\text{N}_3\text{Br})_2\text{MnCl}_2 \cdot 4\text{H}_2\text{O}$

The X.R.D. pattern of complex recorded in  $2\theta$  range  $0^\circ$ - $80^\circ$  (fig-3) possesses a strong and intense peak at  $29.21^\circ$  for the  $\text{Se}_4\text{N}_3$  ring. From the X-ray pattern the values of  $\sin^2\theta$ , miller indices, hkl, and inter planar distances 'd', calculated, resembles to the theoretical values (Table-2). From these X.R.D. data, the values of axial ratio and axial angles (Table-2) calculated are corresponding  $a_0 \neq b_0 \neq c_0$  and  $\alpha = \beta = \gamma = 90^\circ$  for the orthorhomboidal geometrical packing of the molecule in the complex.
