ABSTRACT

We studied non-bonded interaction of the $[\text{Co}(\text{CN})_6]^{3-}$ complex Situated $\text{B}_{24}\text{N}_{24}$ nanoring. Early, the geometry of $[\text{Co}(\text{CN})_6]^{3-}$ and $\text{B}_{24}\text{N}_{24}$ have been optimized at B3LYP method with Def2-SV(P)/ LANL2DZ(ECP) and EPR-II basis set respectively. To confirmation the structural stability of the $\text{B}_{24}\text{N}_{24}\text{-}[\text{Co}(\text{CN})_6]^{3-}$ nano system, delocalization of electrons between donor and acceptor bonds and LUMO and HOMO for the lowest energy have been computed by DFT/ B3LYP method. Then we investigated NBO data such as coefficients and hybrids of orbitals, second order perturbation theory analysis of fock matrix, and "E in different loops of the nanoring have been calculated at B3LYP method.

Key words: DFT, ECP, EPR-II basis set, HOMO, LUMO, NICS.

INTRODUCTION

There has been a noticeable regard in experimental researches of B_nN_m nanoring. B_nN_n have been provided by reaction of BCl_3 with NH_3 in a laser beam^{1,2}. The experimental data of synthesis and various spectrometers are requirement to guess structural stabilities and consider physical chemistry properties of such molecules of $\text{B}_{24}\text{C}_{12}\text{N}_{24}$ molecule³ and the $\text{B}_{12}\text{N}_{12}$, $\text{B}_{16}\text{N}_{16}$ and $\text{B}_{28}\text{N}_{28}$ molecules⁴⁻⁶. In present work we have utilize single wall $\text{B}_{24}\text{N}_{24}$ borane nitride nanoring. The schematic of $\text{B}_{24}\text{N}_{24}$ is displayed in the Figure 1. After valence bond theory was corroborated, Molecular orbital

theory had been prospered. Thus, we presentation the non-bonded interaction of the $[\text{Co}(\text{CN})_6]^{3-}$ Situated $\text{B}_{24}\text{N}_{24}$ nano ring. The basically purpose of this investigation was the study of the electromagnetic interactions within the $\text{B}_{24}\text{N}_{24}\text{-}[\text{Co}(\text{CN})_6]^{3-}$ system. For further evaluation about electromagnetic interactions, stability structure of $[\text{Co}(\text{CN})_6]^{3-}$ complex affected various loops of nano ring have been computed. For further structural data, bond gaps and the hybrids on atom have been reported to estimate the structural ability of the $[\text{Co}(\text{CN})_6]^{3-}$ to make a stable $\text{B}_{24}\text{N}_{24}\text{-}[\text{Co}(\text{CN})_6]^{3-}$ system.

Computational details

To determination electromagnetic interactions of the $[\text{Co}(\text{CN})_6]^{3-}$ complex inclusive Co (III) and six π -acceptor ligands, the geometry of the $[\text{Co}(\text{CN})_6]^{3-}$ was optimized at DFT/B3LYP method with Def2-SV(P) basis set and LANL2DZ Effective Core Potential. Also, the geometry of the mix of $\text{B}_{24}\text{N}_{24}$ nanoring and $[\text{Co}(\text{CN})_6]^{3-}$ complex was optimized at DFT/B3LYP method with EPR-II basis set. Thermochemical properties were determined at B3LYP/EPR-II basis set to analyze the enthalpies and Gibbs free energies⁷. The natural bond orbital (NBO) calculations^{8,9} has been used to theoretical predictions the intermolecular orbital interactions in the $[\text{Co}(\text{CN})_6]^{3-}$ and $\text{B}_{24}\text{N}_{24}-[\text{Co}(\text{CN})_6]^{3-}$ ¹⁰. So, NBO data including coefficients and hybrids of orbitals of

atoms, donor-acceptor bonds and "E in $[\text{Co}(\text{CN})_6]^{3-}$ complex affected various loops of the $\text{B}_{24}\text{N}_{24}$ nanoring have been determined.

RESULTS AND DISCUSSION

To calculate the non-bonded interaction of $\text{B}_{24}\text{N}_{24}-[\text{Co}(\text{CN})_6]^{3-}$ nano system, the structure of the $\text{B}_{24}\text{N}_{24}$ have been optimized at B3LYP/EPR-II basis set and structure of the $[\text{Co}(\text{CN})_6]^{3-}$ complex including cyanide that known as six \AA -acceptor ligands, have been optimized at B3LYP/Def2-SV(P) basis set and LANL2DZ ECP. The non-bonded electromagnetic interactions of the $[\text{Co}(\text{CN})_6]^{3-}$ complex Situated nanoring have been investigated at B3LYP in different loops of the $\text{B}_{24}\text{N}_{24}$ nanoring.

N (10)	2s	1.58726	-0.18837	Optimized parameters of $[\text{Co}(\text{CN})_6]^{3-}$ consists bond lengths and bond angles have been reported in Table 1. We can get all of the Co-C bond lengths are the same in values and all of the C-N bond lengths are same to other, because the octahedral compounds that are Low-spin d ⁶ electronic configuration such as Co (III) with six π-acceptor ligands no indicate the Jahn–Teller distortion. But the octahedral compounds that are High-spin d ⁶ electronic configuration such as Co (III) with six σ-donor ligands indicate the Jahn–Teller distortion ¹¹ . Pursuant the occupancy and energy values of Co (III) metal in Table 2, we can get that 3d _{y_z} , 3d _{x_y} , 3d _{z₂} orbitals include two electrons and the least value of energy. The other d orbitals and 4s orbital include no electron. Also, Pursuant the occupancy and energy values of 6 π-acceptor ligands it was demonstrated that 2s orbital of N atom participate to creation the σ molecular orbitals and one non bonding electron pairs of N situate in 2p orbital that has higher energy level. For instance, in N(8) and N(13) that are in same position relative to the Co (III), 2p _y has a higher energy levels and 2p _x and 2p _z have lower energy levels. In addition, pursuant Table 2 data, atom pairs N(8)-N(13), N(9)-N(11), N(10)-N(12) in $[\text{Co}(\text{CN})_6]^{3-}$ complex that are in same position relative to Co (III), have the same occupancy and energy levels (Fig. 1). The energy level difference of metal-ligands bonding in $[\text{Co}(\text{CN})_6]^{3-}$ complex have been reported in Table 3. We can understand, the size of "o" is determined by the ligand field strength. (CN) ⁻ ligand is a strong field ligand that increase "o" more than F ⁻ ligand as weak field ligand. Determination of second order perturbation theory analysis of fock matrix of C and N atoms at the level of B3LYP/EPR-II basis set and Co (III) atom at the level of B3LYP/ Def2-SV(P)/LANL2DZ (ECP)

Def2-SV(P) basis set and LANL2DZ ECP for Co (III). According to the electron paramagnetic resonance (EPR) calculate, it is noteworthy that the energy obtained from the mentioned basis set and ECP for alone $\text{B}_{24}\text{N}_{24}$ nanoring and alone $[\text{Co}(\text{CN})_6]^{3-}$ complex were equal to -1911.727563 and -701.1710148 (Hartree) respectively. To describes the non-bonded interaction of $[\text{Co}(\text{CN})_6]^{3-}$ affected eight various loops of $\text{B}_{24}\text{N}_{24}$ nano ring, we focus on quantities values such as the relative energies ("E), dipole moment (r), nuclear repulsion energy, NICS and bond gap that mentioned values have been displayed in Table 6. Atomic charge is the physical property of matter that causes it to experience a force when close to other electrically charged matter. So, total atomic charge of alone $[\text{Co}(\text{CN})_6]^{3-}$ complex atoms and under different loops of $\text{B}_{24}\text{N}_{24}$ nanoring, have been reported in Table 7. Also, Bond Length, Total atomic charges and Dipole orientation of atoms of different loops of nanorings have been displayed in Table 8. Magnetic Resonance parameters of $[\text{Co}(\text{CN})_6]^{3-}$ complexes under three CSGT, GIAO, IGAIM methods have been shown in Table 9.

CONCLUSION

In this study, Density functional theory calculations with EPR basis sets have been employed to determination non-bonded interaction. In accordance with Table 3, definition the magnitude of " under strong field ligands, such as (CN)⁻, equal to 0.25308 a.u. . In accordance with Table 1, [Co(CN)₆]³⁻ complex with strong field ligands no exhibit the Jahn-Teller distortion. It has been displayed at Table 5 that the bonding coefficients of s, p and d orbitals were 0.3 and anti-bonding coefficients of Co-C bonds were 0.8 and Co-N bonds were 0.7. In accordance with NICS values of Table 6, it's displayed that loops1,3 and 5 have

similar NICS values and equal to -10.1058 and loops 2,4 and 6 have similar NICS values and equal to -10.1189. So, the more negative NICS values, the aromaticity and magnetism that loops most. According to different NMR methods of Table 9, characterize that CSGT and GIAO methods have similar quantity.
